# Why Are Primers Important?

PCR Reagents

- PCR buffer
- dNTP Mix
- Taq DNA polymerase
- **Primers**
- Template
- DDW
- DNA

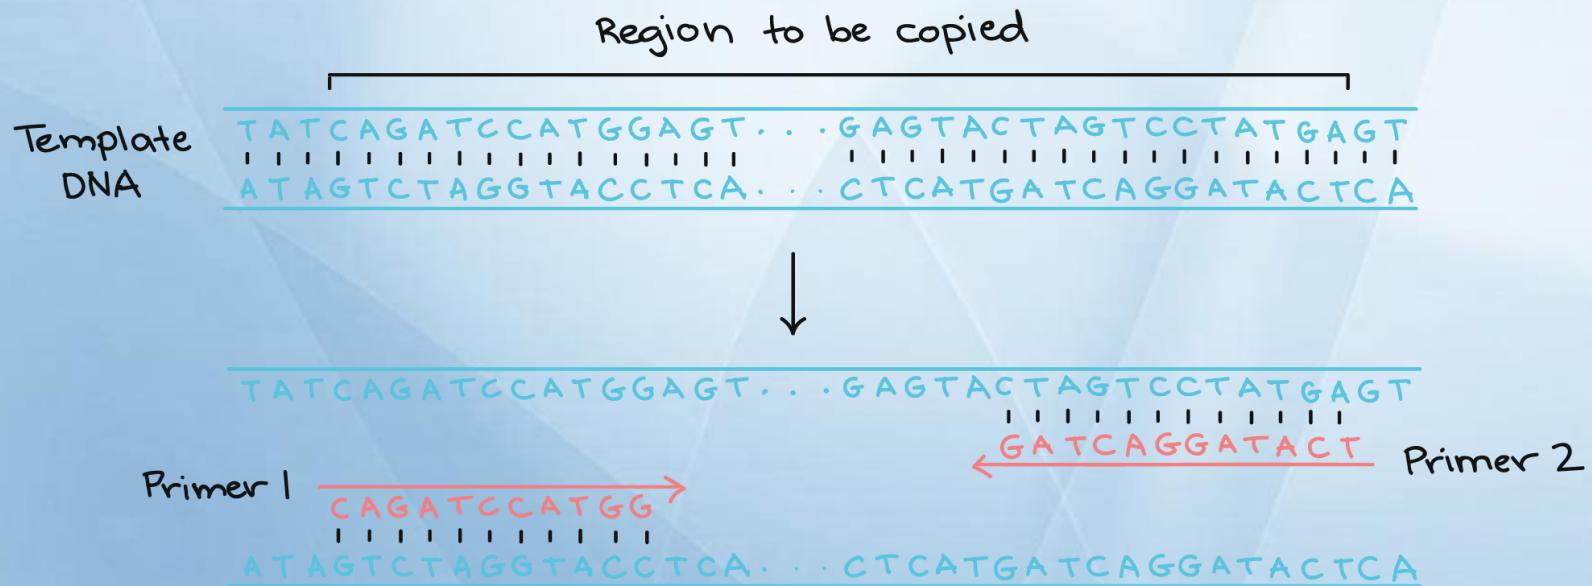

◆ Primers are what gives PCR its  
**SPECIFICITY!!!**

- ◆ Good primer design: PCR works great.
- ◆ Bad primer design: PCR works terrible.

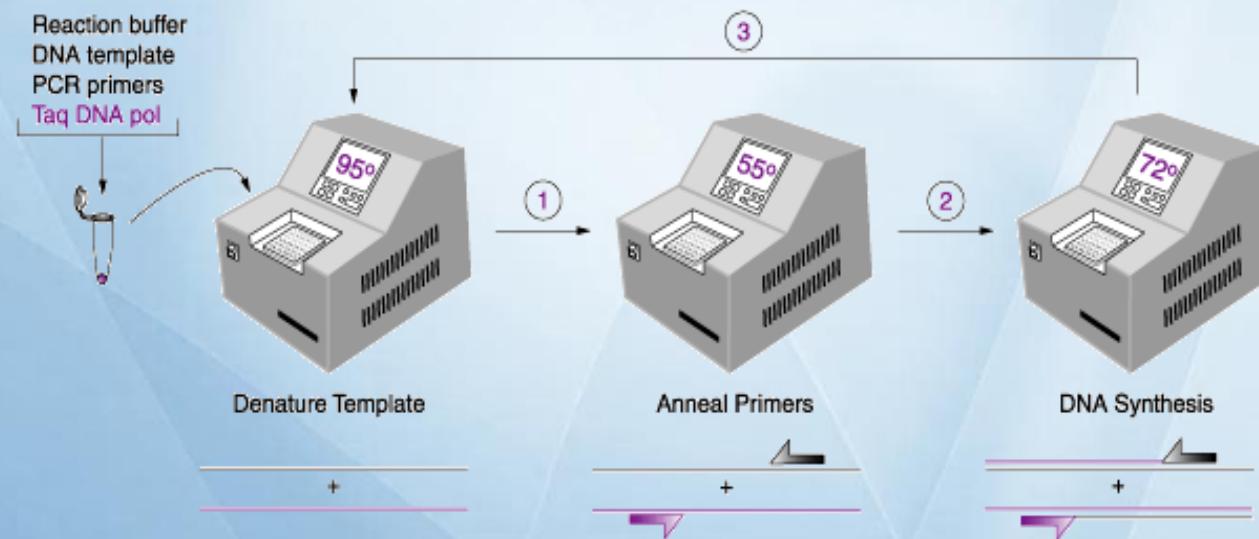

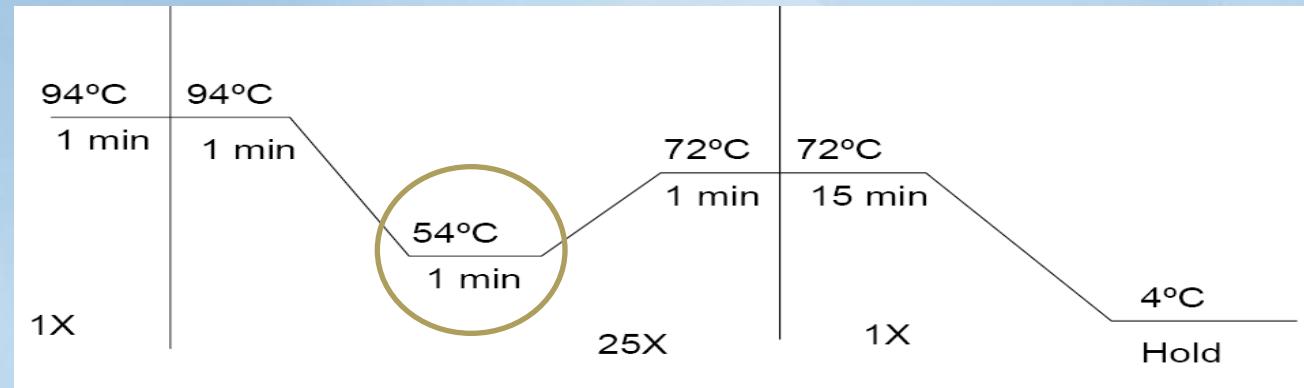

# What is a primer?

A primer is a short synthetic oligonucleotide which is used in many molecular techniques from PCR to DNA sequencing. These primers are designed to have a sequence which is the reverse complement of a region of template or target DNA to which we wish the primer to anneal.

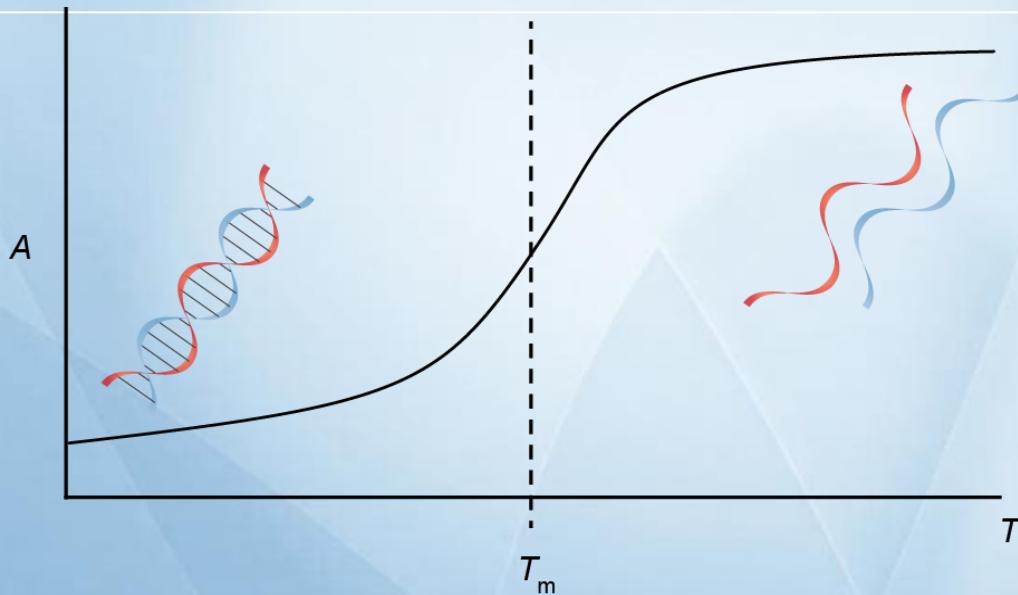

# Programming the Thermocycler

## Primer melting temperature ( $T_m$ ):

The melting temperature ( $T_m$ ) is the most important factor in determining the optimal PCR annealing temperature ( $T_a$ ).

# Tm Calculation

- ◆ Wallace rule:

$$Tm = 4 * (G + C) + 2 * (A + T)$$

- ◆ Bolton and McCarthy:

$$Tm = 81.5 + 16.6 * \log [I] + 0.41 * (\%GC) - 600/L$$

- ◆ The nearest neighbor method (Santalucia et.al, 1998):

$$Tm_{NN} = \frac{\Delta H}{\Delta S + R \cdot \ln\left(\frac{c}{4}\right)} - 273.15 + 16.6 \cdot \log(K^+)$$

## Melting Temperature

Oligo sequence

Length  GC%  MW(kD)

Melting Temperature (°C):

Thermo  Hybrid  GC+AT

[DNA] (nM)  DNA/RNA   
[Na<sup>+</sup>](mM)  Formamide(%)   
Mismatch(bp)

## Melting Temperature

Oligo sequence

Length  GC%  MW(kD)

Melting Temperature (°C):

Thermo  Hybrid  GC+AT

[DNA] (nM)  DNA/RNA   
[Na<sup>+</sup>](mM)  Formamide(%)   
Mismatch(bp)

# Good Primer's Characteristic

## Primer length

GTGGATGTGGTGTGATGGC

**18-24 bp for general applications**

# General rules for primer design

- ❖ **Primer length determines the specificity and significantly affect its annealing to the template**
  - Too short -- low specificity, resulting in non-specific amplification
  - Too long -- decrease the template-binding efficiency at normal annealing temperature due to the higher probability of forming secondary structures such as hairpins.

Too short---less specific  
Too long---wasting money

# Base Composition

- Usually, average (G+C) content around **50-60%** will give us the right melting/annealing temperature for ordinary PCR reactions, and will give appropriate hybridization stability.

5 GTGGATGTGGTGTGATGGC 3

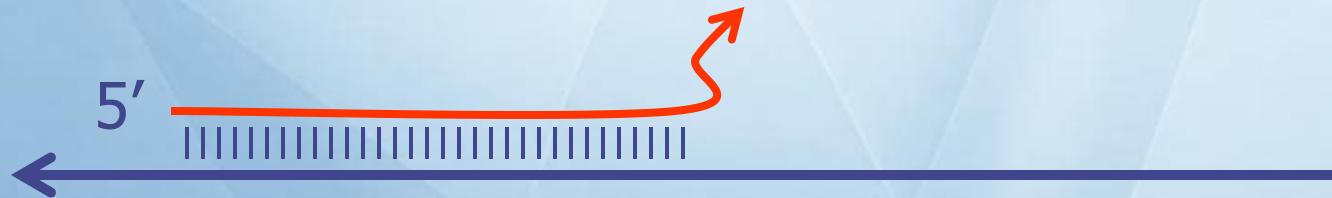

# Max 3'end stability

It's critical that the stability at 3' end be high

5 GTGGATGTGGTGTGATGGC 3

# Primer Pair Matching

Primers work in pairs – forward primer and reverse primer. Since they are used in the same PCR reaction, it shall be ensured that the PCR condition is suitable for both of them.

One critical feature is their annealing temperatures, which shall be compatible with each other. The maximum difference allowed is 3 °C. The closer their  $T_{\text{anneal}}$  are, the better.

5' CTGATCAAGTCGATGGCTTG 3'	Fw	59 C
5' GATGGAGAGGGCTTGACTGC 3'	Rv	58 C

# Preferred melting temperature

**Melting Tm between 50-70 °C are preferred**

# Avoid

## A. Avoid hairpin and stem-loop formation

Hairpin:  $^2 G = -0.7$  kcal/mol, Loop = 8 nt, Tm = 41°

## ● Avoid complementary at 3' end of primers

### Primer dimer formation

Primer, the arrow indicates the elongation side, i.e., the 3' end,

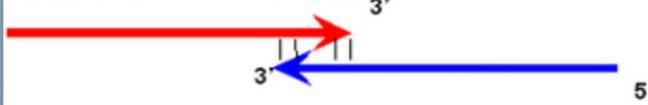

DNA elongated from the 3' end of the primer

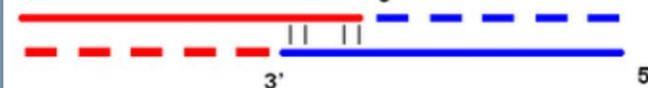

Hydrogen bonds between two complementary bases

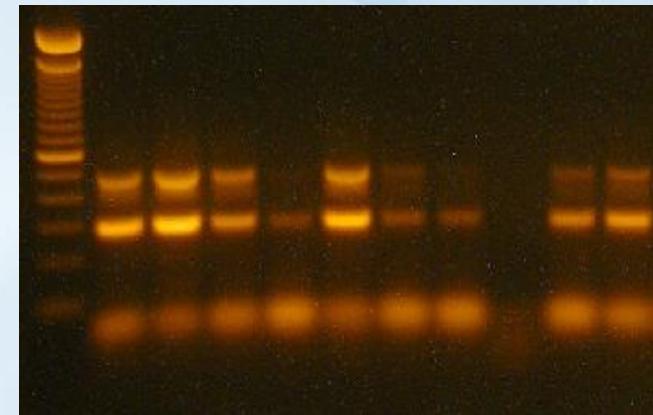

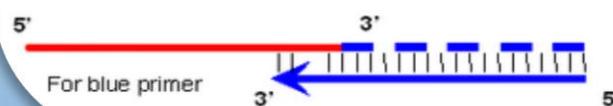

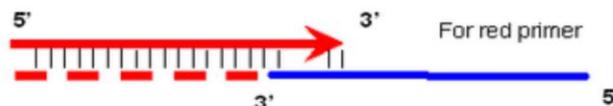

Step I: the primers are attached in their 3' end

Step II: the primers are elongated by DNA Polymerase

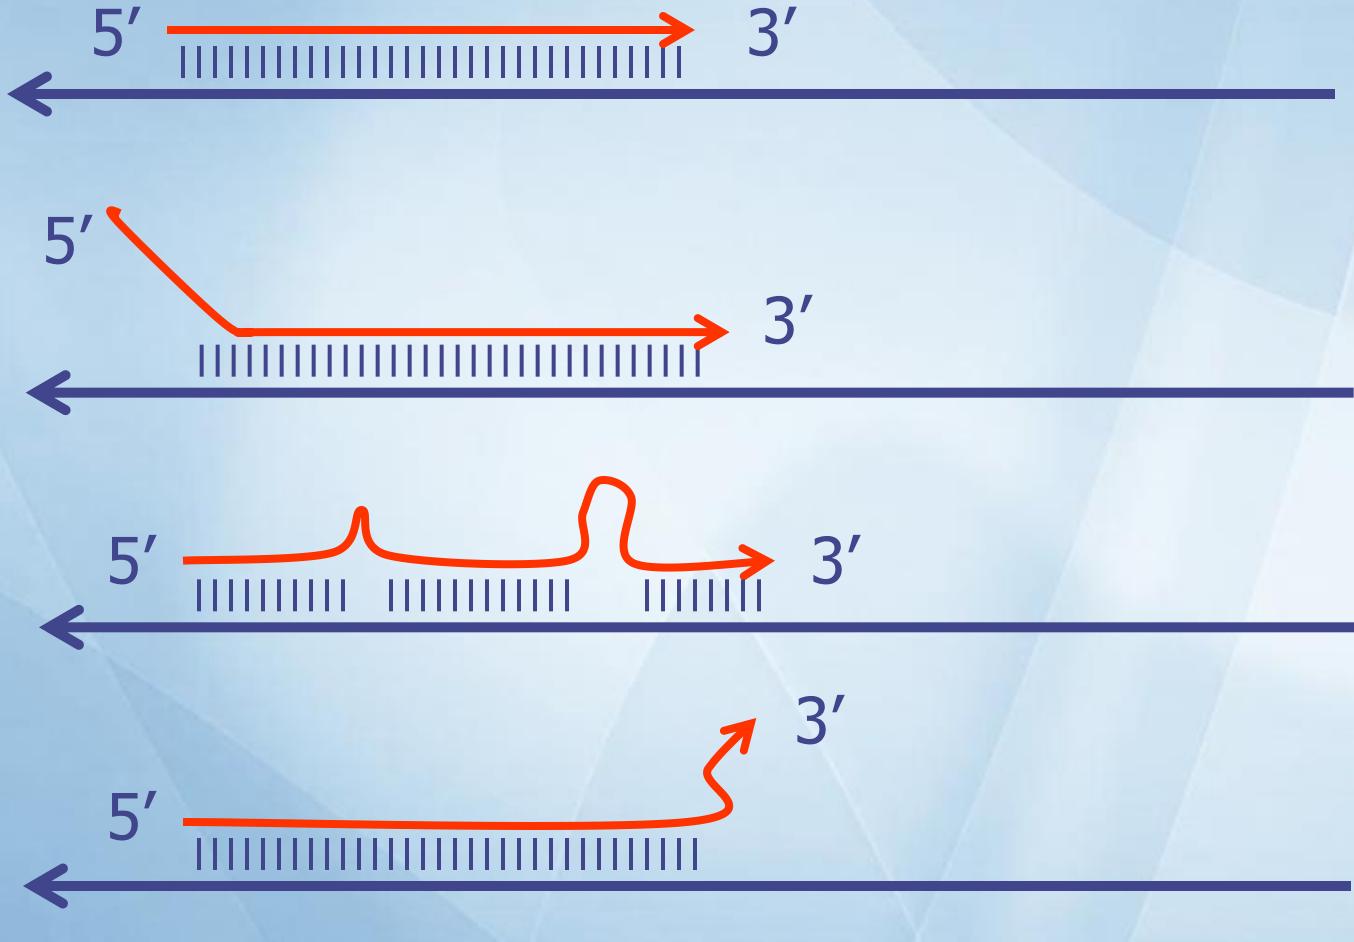

Step III: in the following cycle the elongated primer binds its complementary primer with high affinity

# when is a “primer” a primer?

# PCR primers are designed to:

For Cloning a special sequence

Full length

For Detection  
100 - 500 bp

Random  
??

- Gene of interest
- Gene expression ( mRNA)
- Microbial agents detection
- Mutation Detection
- Quantification
- Allelic discrimination
- Disease
- ...

## Installable Softwares

Software name	Description
Primerselect	Analyses a template DNA sequence and chooses primer pairs for PCR and primers for DNA sequencing
DANSIS Max	DANASIS Max is a fully integrated program that includes a wide range of standard sequence analysis features.
Primer Primer 5	Primer design for windows and power macintosh.
Primer Primer:	Comprehensive primer design for windows and Power Macintosh.
NetPrimer	Comprehensive analysis of individual primers and primer pairs.
Array Designer 2	For fast, effective design of specific oligos or PCR primer pairs for microarrays.
AlleleID 7	Design molecular beacons and TaqMan probes for robust amplification and fluorescence in real time PCR.
GenomePRIDE 1.0	Primer design for DNA-arrays/chips.
Fast PCR	Software for Microsoft Windows has specific. Ready-to-use template for many PCR and sequencing applications; standard and long PCR inverse PCR. Degenerate PCR directly on amino acid sequence. Multiplex PCR.
OLIGO 7	Primer Analysis Software for Mac and Windows.
Primer Designer 4	Will find optimal primers in target regions of DNA or protein molecules, amplify features in molecules, or create products of a specified length.
GPRIME	Software for primer design.
Sarani Gold	Genome Oligo Designer is a Software for automatic large scale design of optimal oligonucleotide probes for microarray experiments.
PCR Help	Primer and template design and analysis.
Genorama chip Design Software	Genorama Chip Design Software is a complete set of programs required for genotyping chip design. The programs can also be bought separately.
Primer Designer	The Primer Designer features a powerful, yet extremely simple, real-time interface to allow the rapid identification of theoretical ideal primers for your PCR reactions.
Primer Primer	Automatic design tools for PCR. Sequencing or hybridization probes, degenerate primer design, restriction, Nested/Multiplex primer design, restriction enzyme analysis and more.
PrimerDesign	DOS-program to choose primer for PCR or oligonucleotide probes.

# Primer3

## Primer3

(v. 0.4.0) Pick primers from a DNA sequence.
