

Surgical Management of Squamous Cell Carcinoma and Papillomatosis in Cattle and Sheep

N.A. Misk, J. M. Nigam and J.F. Rifat

Abstract:

Cutaneous neoplasms are of particular interest in veterinary medicine. The common growths recorded in the present study are squamous cell carcinomas and papillomas. Squamous cell carcinomas are more recorded in sheep than in cattle. Papillomas affect cattle more than sheep. Surgical excision appears to be satisfactory except in those cases in which the clusters of growths surround some vital structures.
