

A clinical Aspect in the Management of Some Tumours in Donkeys.

N.A. Misk, S.F. Ismail, S.M. Seleim and A.H. Bayoumi.

Abstract:

Neoplastic diseases of the donkey are rarely documented in present literature. The four cases described in this article were selected from a large number of oncologic cases in this species and represent common presentations and treatments. In all the four donkeys described here, the tumors were occluding body orifices. Histopathological examination revealed a fibroma in two cases, a fibromyxoma in one case, and a fibropapilloma in another case. Surgical treatment is described.
