CT of submucosal and occult laryngeal masses

AA Mancuso, EM Saleh, SP Stringer

Abstract:

This paper reports on the role of CT in evaluating patients with entirely submucosal laryngeal mass lesions and the range of pathology encountered in this population. Twenty-four patients with submucosal mass lesions were studied over a period of 15 years. Charts were reviewed to establish the presenting complaints, time to diagnosis, and number of endoscopic procedures required to make the diagnosis. Final diagnoses were confirmed.
