A feasibility study of transurethral resection followed by radiotherapy combined with concurrent twice-weekly gemcitabine in the treatment of invasive bladder carcinoma

Dalia Osama, Mohamed Shalaby, Mohamed Abdelhamed Aboziada

Abstract:

Tri-modality bladder-sparing approach consists of transurethral resection, chemotherapy twice weekly Gemcitabine and radiotherapy is well tolerated, with high rate of bladder preservation. This approach may be considered as a reasonable alternative to cystectomy in the proper selected patients.

Keywords:

bladder preservation, chemoradiation
