

Impact of negative pressure wound therapy in complete healing rates following surgical debridement in heel and ankle regions in diabetic foot infections

Ayman Hasaballah, Hesham Aboloyoun, Ahmed Elbadawy, Manal Ezeldeen

Abstract:

Aim The aim was to evaluate 120-day complete wound healing rates in negative pressure wound therapy (NPWT) versus conventional dressings in anatomically challenging areas (the heel and ankle regions). **Patients and methods** A retrospective, cohort study that included diabetic patients having acute (
